MISSION THREADS

Harry Hunter

TD

SPAWAR 051JRAE PROJECT

15 NOV 05

Approved for public release; distribution is unlimited

Sponsored by **SPAWAR**
SPAWARSYSCOM
FORCEnet Chief Engineer

The Problem

- Mission threads are used by the individual services to allow:
 - The capability to analyze and assess the functionality of a system or family of systems
 - To design and conduct experiments
 - Testing and certifying systems for fielding
 - Development of training programs
- These mission threads have been for the most part used by the services to focus on their individual requirements and not to view across the battle space to allow joint collaboration

SO WHAT THREADS DO WE USE

The Problem (Continued)

- In general, each service has some "tool" that can provide similar, if not the same, types of mission thread functions for themselves. An example is Time Sensitive Targeting (TST).
- The difficulty arises when warfighters need to look across the battlespace and find targets, check for duplicates, check the status etc, they are confronted with a time-intensive process.
- *"Typically when this need arises, there are a lot of phone calls, e-mails, chats, manual documents that are coordinated and passed. Once a person gets target data from another source, it is up to them to try and figure out if it is a TST, a duplicate of one they have, etc. This can take a long time and a lot of manpower if the number of targets is large or the Area of Interest is large."* **OIF Warfighter**

THIS PROBLEM EXISTS FOR NUMEROUS MISSIONS.

TST in particular provides a common point for all agencies and warfighters to work together from the AS IS to the TO BE:
from start to finish of a warfighting process

discussions

Objectives

KISS

- The objectives we should be striving to accomplish are, using net centric warfare, simply
 - Improve the timeliness of information available to the warfighter.
 - *(operating within the enemies ability to react – controlling the situation)*
 - Improve the accuracy of the information provided.
(Common, validated information within the battlespace)
 - Workload reduction and productivity improvement. (More machine to machine interfaces, better data fusion and situational awareness)

THIS SIMPLE PROCESS CAN BUILD A SOLID NETCENTRIC FOUNDATION BETWEEN THE WARFIGHTER AND HIS NUMEROUS ENABLING AGENCIES

The Common Point

1. ISR Data Sharing
2. Target List Mgt.
3. Combat ID
4. Weapons Coordination
5. Effects Analysis
6. Dynamic Assessment
7. ISR re-tasking

NAVY
MARINES
ARMY
AIR FORCE
JOINT
OGA
COALITION

- Time Sensitive Targeting- *effects based* operations threads: Joint Staff/ JFCOM approved
 - Incorporates all the war fighting threads

PLAN FIND FIX TRACK TARGET
ENGAGE ASSESS

HEAVY ENGAGEMENTS TO POLITICS
BOMBS ON TARGET - RIOT CONTROL - POLITICAL EFFECTS

ASSESSMENT

CERTIFICATION

EXPERIMENTS

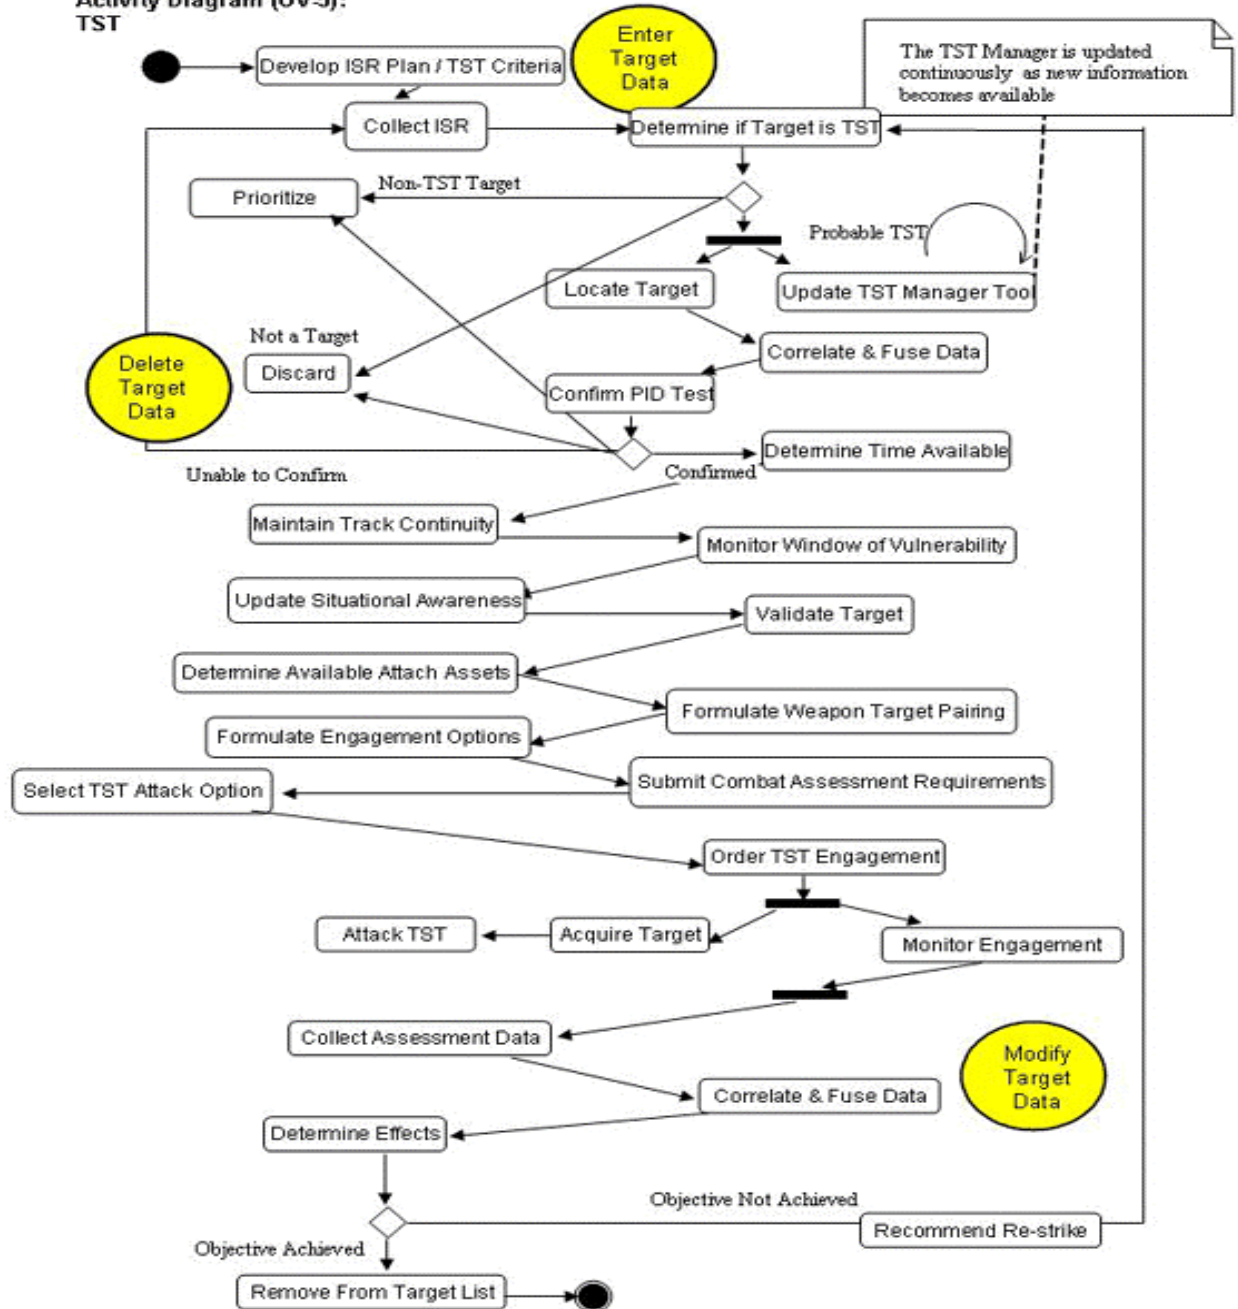

TESTING

FORCENET

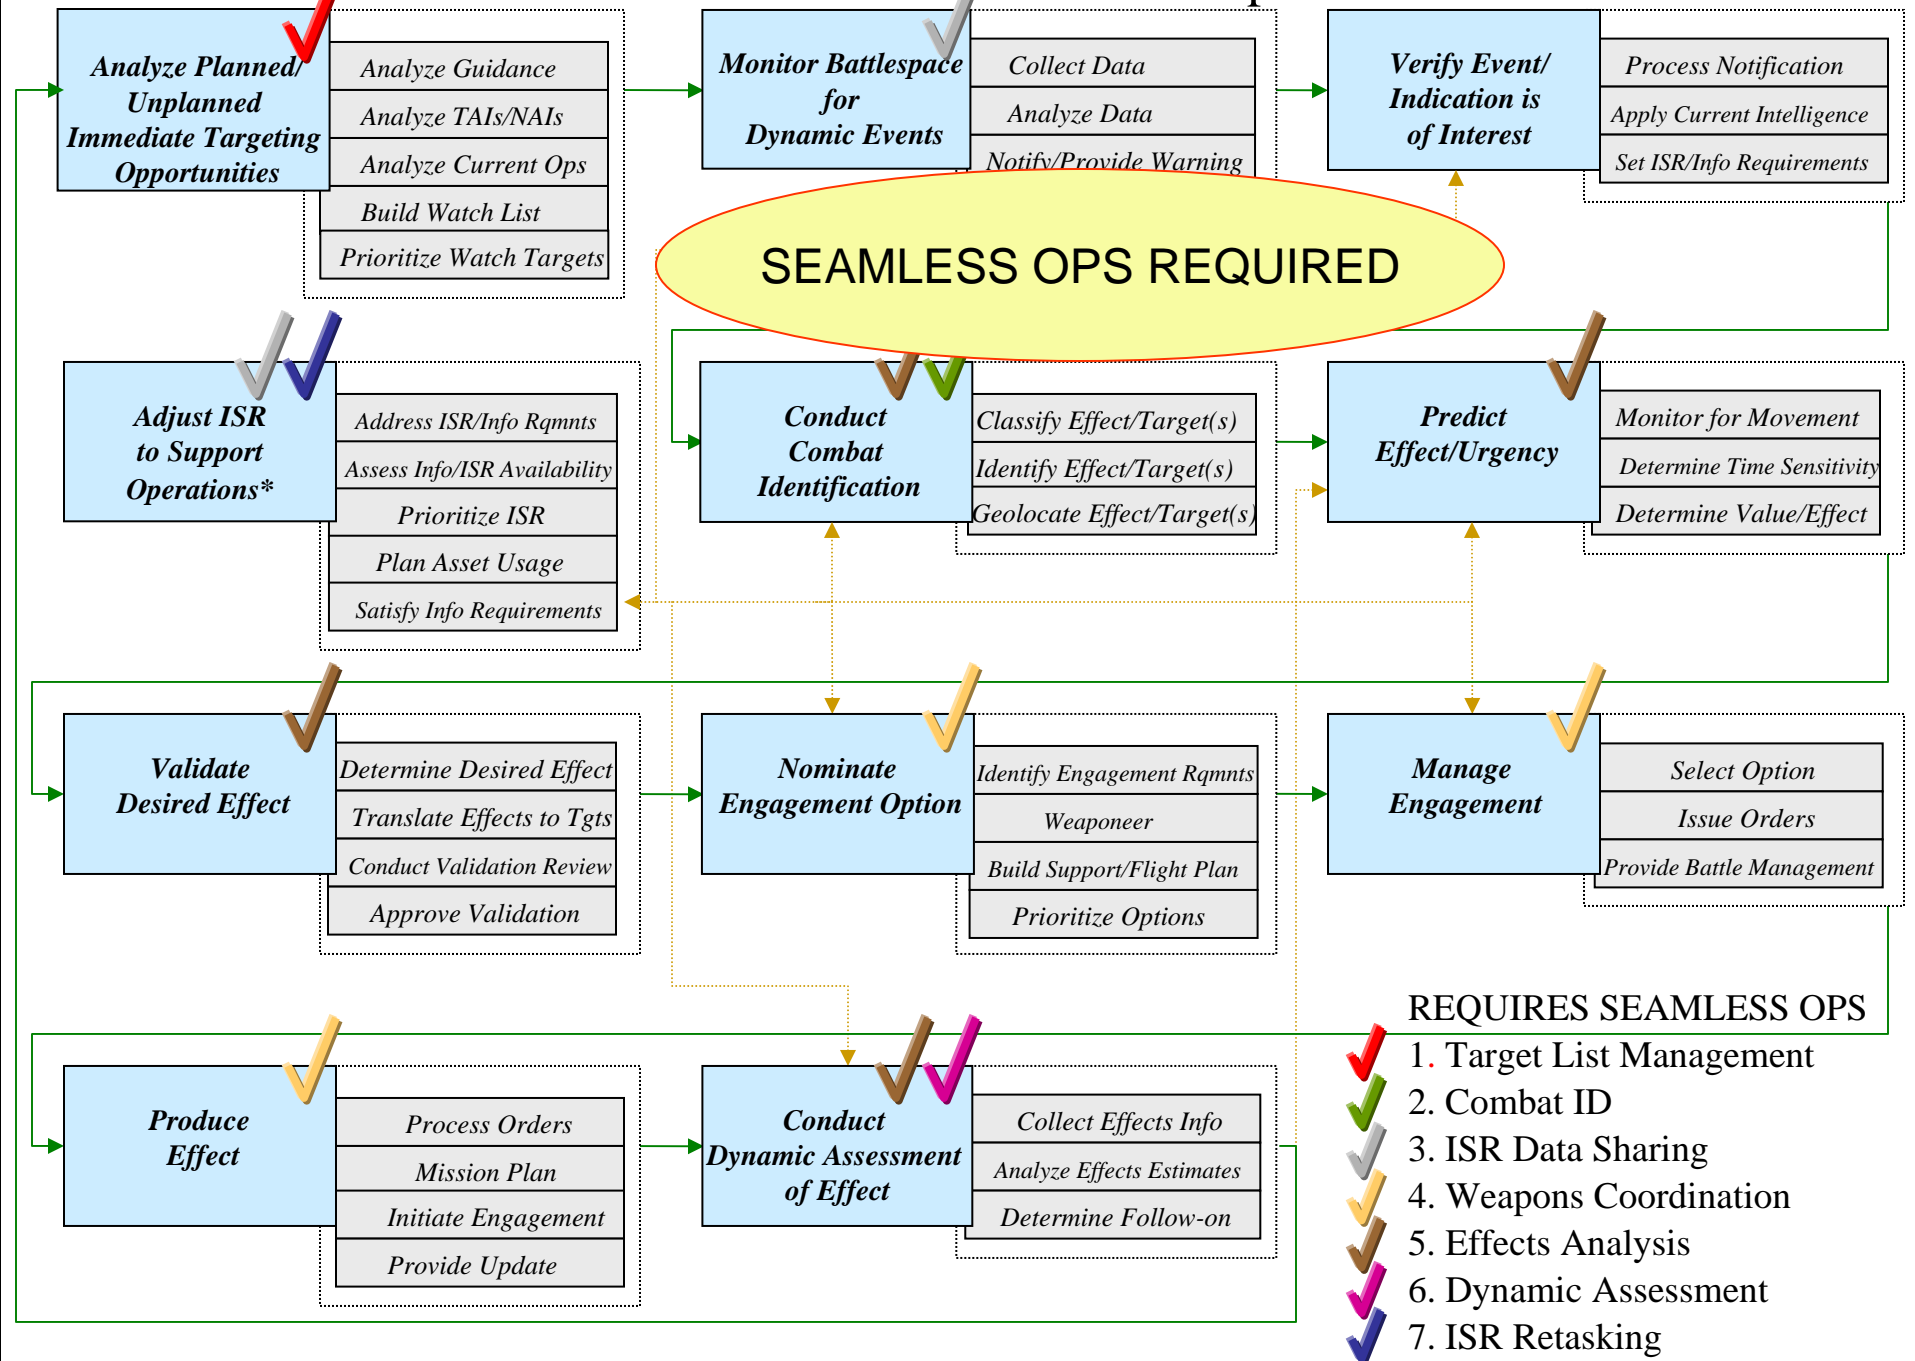

SEAMLESS
NETCENTRIC
OPS

JFCOM Activity Diagram for TST

Activity Diagram (OV-5):
TST

Context: TST : Time Sensitive Effects Operations Thread Model

Example (Continued)

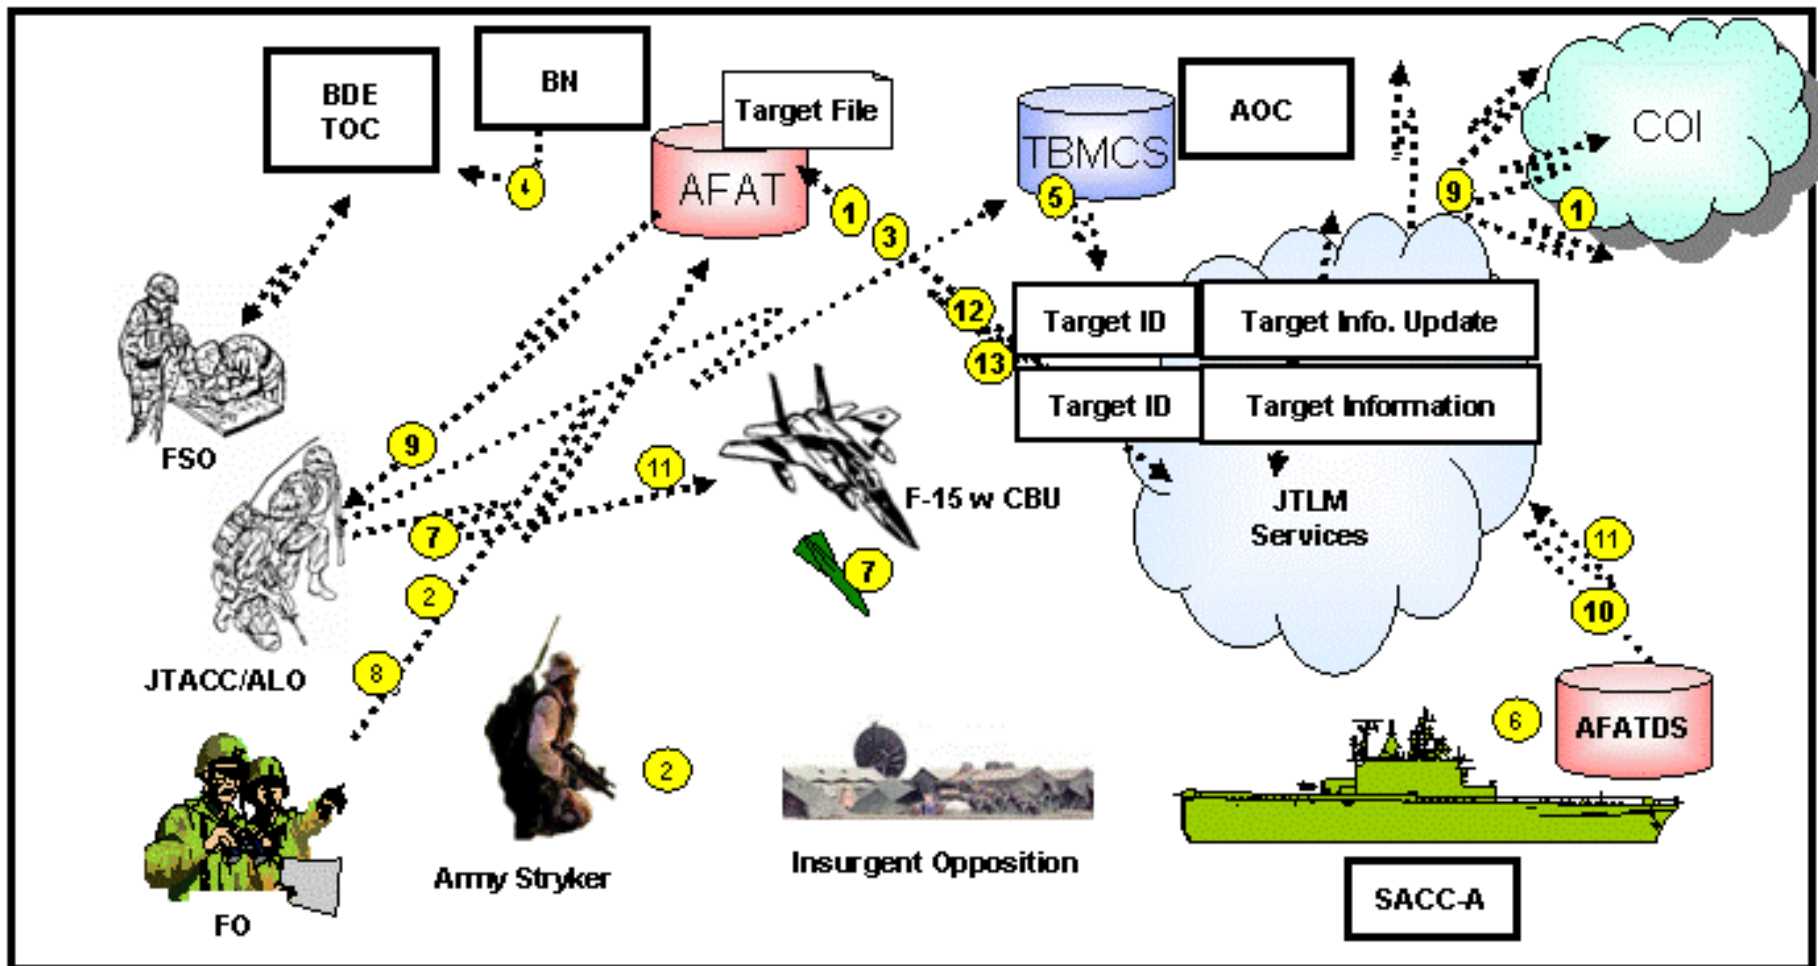

- The use of service oriented architecture (SOA) to improve joint target list management (JTLM)
 - Provide visibility of Joint and Coalition targets to all warfighters within the battle space
 - Allow the inexpensive and effective interface of legacy systems to improve battlespace situational awareness, decision making, engagements

MISSION THREAD IMPROVEMENTS
TIMELINE – ACCURACY - WORKLOAD

Mission Threads

USE THE MISSION THREAD TO FIND METHODS TO
REDUCE WORKLOAD, INCREASE ACCURACY, REDUCE TIMELINES

discussions

Process

KISS principle to get things moving

Seamless ops
required
between services

- Using the JFCOM /JOINT STAFF approved TST Mission Thread as a common starting point to allow WARFIGHTER to provide how the process works today- (AS IS)
- Use these same Mission Threads to determine NETCENTRIC capabilities which can improve timeliness, accuracy and workforce reduction. (TO BE)
 - Use threads for testing
- Once the systems and procedures have been designed to achieve effects based operations, use the mission threads to evolve the new assessments, policies and training.

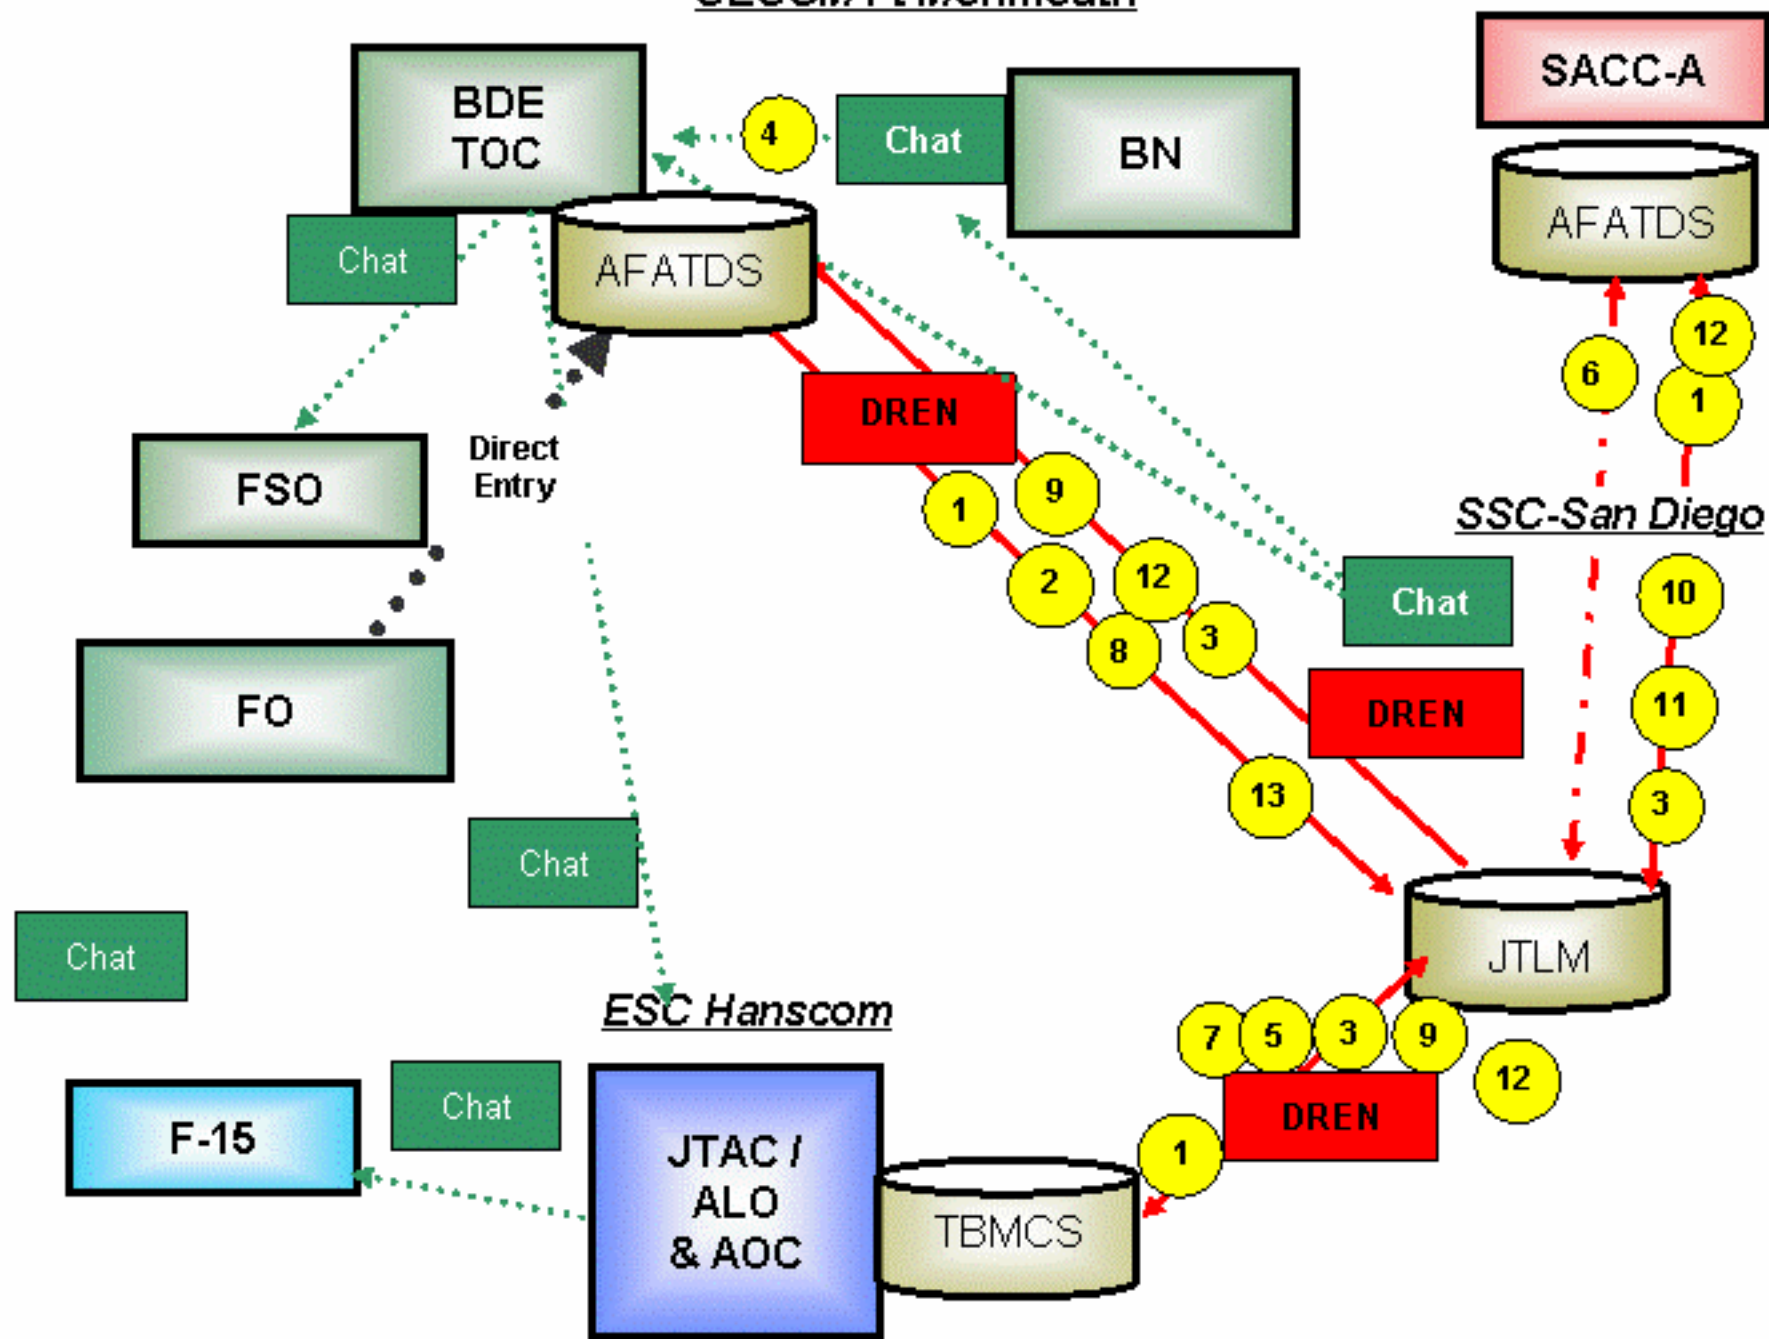

The use of a common TST thread:
which covers all the threads for engagements from single to large scale –
from bullets to politics would be the common starting point between the
warfighter
and his supporting agencies for assessing, testing, experimenting, certifying.
Expand from that point

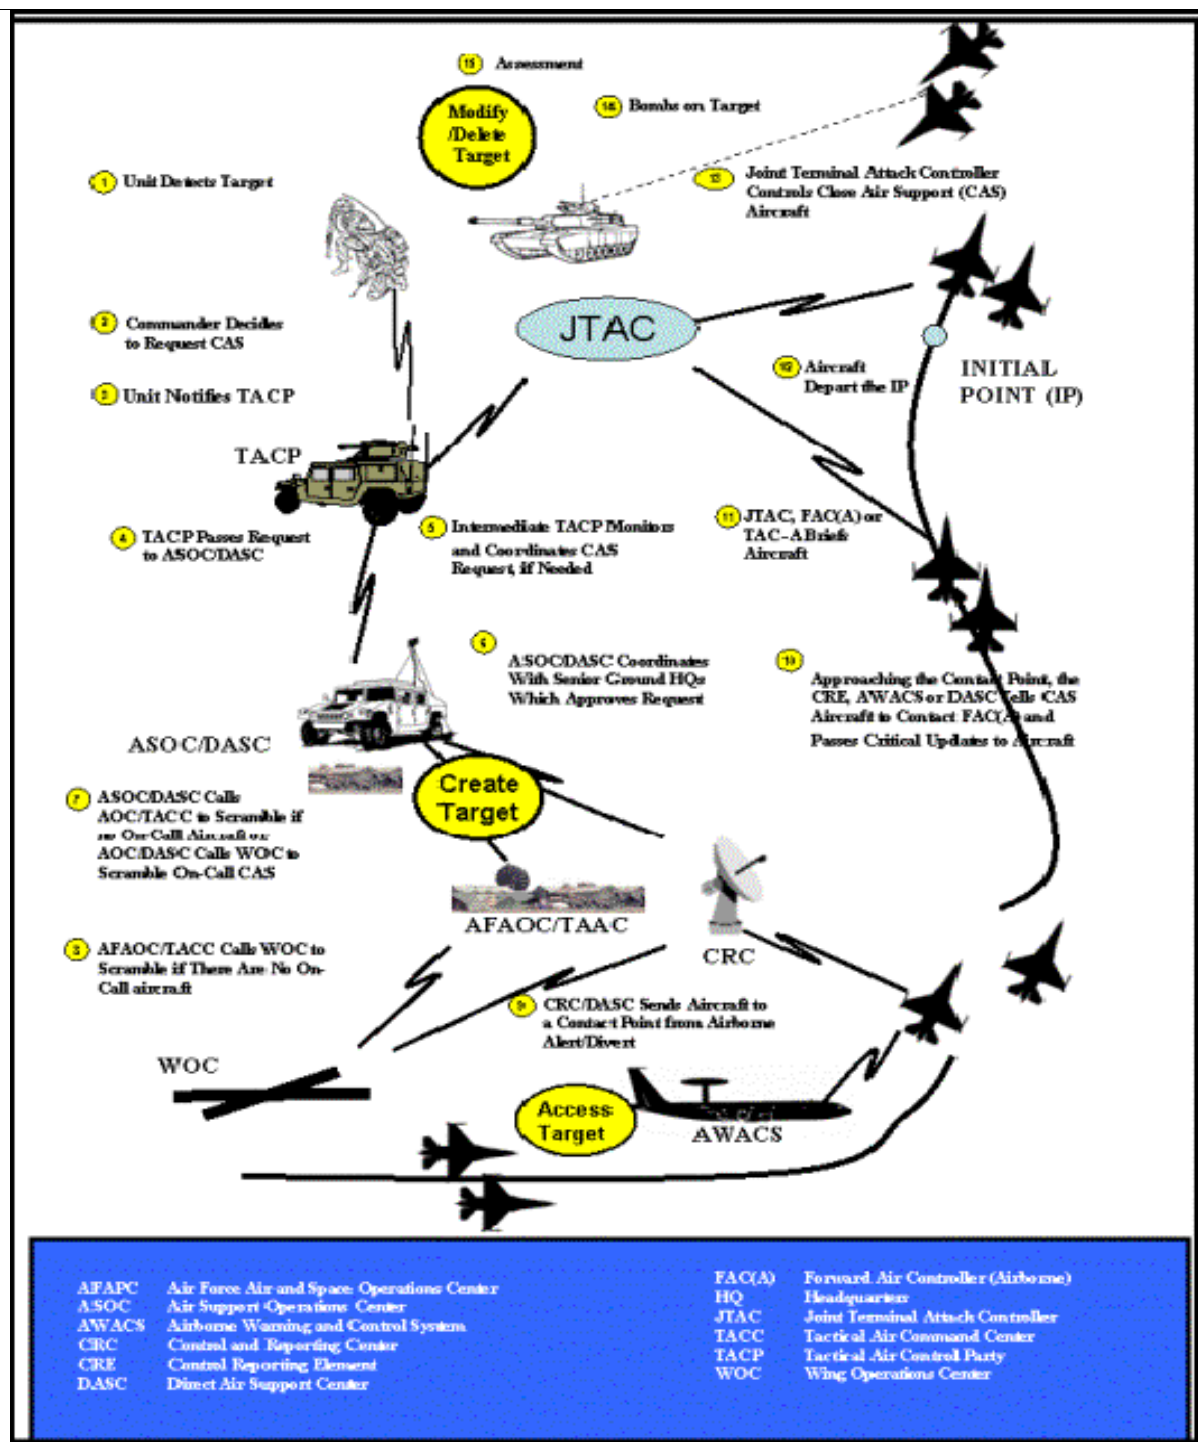

- Identify and ratify a single common joint mission thread for an initial start between the Warfighter and his supporting agencies.
- Pick a working group and a due date for the common thread selection.
- Identify parallel steps to move agencies and services to a common and seamless service oriented architecture to support the mission threads.
- Think seamless – JOINT.

Consider that development with experimentation across agencies using a common Mission thread could allow rapid parallel development of various areas of the architecture resulting in:
faster operational deployment of the capability
